Methodology for Calculating the Index of Cities’ Child-Friendliness (CFC index)

The index of cities’ child-friendliness is calculated based on 7 parameters:

1. Participation of children in social life and decision making.
2. Living environment.
3. Child safety in the city.
5. Education and development.
7. Providing help in difficult situations in life.

Each parameter is assessed vis-à-vis two types of indicators: objective and subjective.

The source of information to calculate objective indicators could be statistical reporting data, including departmental, which is regularly collected by divisions of district executive committees responsible for the respective social sphere. All used data should reflect the situation in the city excluding the district.

The source of information to calculate subjective indicators could be surveys conducted among children aged 6-12, adolescents aged 13-17 and parents of children aged 0 to 12.

For each indicator the normalized value from 0 to 10 is calculated, where 10 means the most favourable conditions, while 0 means the least favourable conditions. The method for calculating the normalized value of the indicator is given in the description of the indicator.

3 basic principles of normalization are applied in the methodology as follows:

1) city data is normalized based on the republican statistics which is accepted as the mean value. If the value of the indicator in the city coincides with the republican statistics, the normalized value of the indicator becomes «5». The better is the statistics in the city as compared to the republican data, the closer is the normalized value of the indicator to «10»;

2) city data is normalized based on the total number of children in the city, whose situation the indicator evaluates. The higher is the share of children who are in a better situation, the higher is the normalized value. If 100% of the described target group of children are in favourable conditions according to the indicator, its value reaches «10»;

3) subjective indicators are normalized based on the share of answers of respondents who evaluate the situation with the indicator positively. If 100% of respondents are satisfied with the state of affairs for the indicator, its value reaches «10».

The normalized parameter value is the mean arithmetic value of the normalized values of all parameter indicators; the formula for calculation is given at the end of the indicator description of each parameter.

The index of child-friendliness is the mean arithmetic value of the normalized values of the 7 parameters.

All indicators, normalized indicator, parameter values and the index are rounded up to the decimal point.
**Sampling for surveys**

Sampling for surveys depends on the city category and is done as follows:

<table>
<thead>
<tr>
<th>City category</th>
<th>Number of survey respondents among children aged 6-12</th>
<th>Number of survey respondents among children aged 13-17</th>
<th>Number of survey respondents among the parents of children aged 0-12</th>
<th>Requirements for the survey</th>

</tbody>
</table>

Cities can decide to survey more respondents to get more accurate survey results.

The survey plan for each interviewer is drafted by the coordinator. Each interviewer must interview approximately the same number of boys and girls when conducting the survey of school children, and approximately the same number of men and women while conducting the parent survey.

1. Respondents for the survey are selected randomly.
2. Surveys are conducted at the campuses upon agreement with the management of an educational establishment.
3. To ensure that all students of an educational establishment are equally likely to become a respondent, interviewers must conduct the survey at different times and in the places where they could meet students of different grades. The best option is conducting interviews at the entrance to the educational establishment.

If the school management suggests that interviewers ask their questions to the students in class, maximum 4 students from each form should be interviewed, and these are to be selected at random (for instance, by drawing lots, or, say, all students sitting at the third desk to the right are interviewed).

*It is absolutely prohibited to interview solely the children who are school activists.*

4. To ensure that all parents of children aged 0-12 are equally likely to become respondents, and that parents living in various parts of the city could be interviewed, the parent survey is better arranged by asking random passers-by in various parts of the city at busy street crossings and squares of the city. If the parent survey is organized at the entrance to/exit from educational establishments and pre-school facilities, it is needed to ensure the ratio of 50/50 respondents interviewed at educational establishments and pre-school facilities.

5. The interviewer can by no means interview his/her relatives or acquaintances, or teachers from the schools their children attend.

To ensure random sampling for the surveys of children aged 6-12 and 13-17, if the survey is conducted at the educational establishment, one could use the following methods for selecting respondents:

1. The interviewer selects respondents at the entrance and exit from an educational establishment.
2. Five or six forms are determined by drawing lots, two respondents of different sexes are invited from each of them; besides, lot drawing is also conducted in each selected class to select those who would participate in the survey among boys and girls.

3. Five or six forms are determined by drawing lots, and from these classes the respondents sitting at a certain desk at a class are invited, for example, respondent 1 sits in maths classes in the mid row at the second desk from the board to the left, and respondent 2 sits in maths classes in the left row at the first desk to the right.

When sampling the parents of children aged 0-12 one should remember to include into the survey the parents of preschool children.

To ensure the random sampling of the parents of children aged 0-12 one could use the following sampling methods:

1. Interviewing respondents in the streets, at the children’s playgrounds or recreation areas.
2. Random interviewing of respondents before or after a general parents’ meeting at the entrance to or exit from the educational establishment / preschool facility.

You should include the description of sampling procedure per each category of respondents into the ‘Introduction’ section of the State of the City’s Children Report.
Justification for the choice of indicators:

A child friendly city warrants the right of each young citizen to influence decision making on the matters affecting their lives and express their opinion on the city they want. Children must be aware of the process of city development, engaged into this process and see in practice that their opinions and experiences are respected, they are acknowledged as partners and individuals, as active citizens with equal rights.

<td>( n_{1.3} = 10^k )</td>
</tr>
<tr>
<td>1.4</td>
<td>Proportion of children aged 13-17 who participated in the election of self-government at the school or city level, as well as in the election of the management of children’s and youth organizations within the last 12 months</td>
<td>Subjective</td>
<td>The indicator is used to measure progress in empowering children’s participation in self-government bodies at the level of school, city, children’s or youth organization</td>
<td>Surveys of children aged 13-17</td>
<td>The indicator is estimated based on the answers to the question: “Have you participated in the election of school or city self-government within the last 12 months?” For answers the following scale is used: yes; no; refuse to answer</td>
<td>Numerator: number of respondents who answered ‘Yes’ Denominator: number of respondents who participated in the survey Indicator is calculated as: $k = \frac{\text{numerator}}{\text{denominator}}$</td>
<td>$n_{1.4} = 10^k$</td>
</tr>
<tr>
<td>1.5</td>
<td>Degree of satisfaction of children aged 13-17 with participation in public life and decision making, as well as degree of satisfaction of parents with involvement in the discussion of issues affecting children</td>
<td>Subjective</td>
<td>The indicator is used to measure the quality of children’s and their parents’ participation in decision making at the city level on the matters concerning the interests of children</td>
<td>Surveys of children aged 13-17 and parents of children aged 0-12</td>
<td>The indicator is estimated based on the answers to the question: “Is it true that you are satisfied with how you are engaged in decision making on the issues affecting your interests?” of the questionnaire for children aged 13-17; “Is it true that you like how the city government engages you into decision making on the issues concerning the interests of your children?” from the questionnaire for the parents of children aged 0-12. For answers the following scale is used: 4 – absolutely true, 3 – more true than false, 2 – true and false to the same extent, 1 – more false than true, 0 – absolutely false</td>
<td>Numerator: $4^a + 3^b + 2^c + 1^d + 0^e$, where $a$ is the number of respondents of two surveys who answered ‘absolutely true’, $b$ - number of respondents who answered ‘more true than false’, $c$ - number of respondents who answered ‘true and false to the same extent’, $d$ - number of respondents who answered ‘more false than true’, $e$ - number of respondents who answered “absolutely false” Denominator: number of respondents who participated in two surveys Indicator is calculated as: $k = \frac{\text{numerator}}{\text{denominator}}$</td>
<td>$n_{1.5} = k/4^10$</td>
</tr>
</tbody>
</table>

The normalized parameter value is calculated from the formula:

$$ P_1 = \frac{n_{1.1} + n_{1.2} + n_{1.3} + n_{1.4} + n_{1.5}}{5} $$
Description of indicators per parameter 2
‘Living environment’

Justification for the choice of indicators:

A child friendly city warrants the right of each young citizen to have access to comfortable accommodation, proper sanitation, well-furnished areas for games and sports, and to green spaces. Disabled children must have a possibility of unhindered exit from living room spaces in order to meet and play with their friends, attend school, outpatient clinic and other institutions.

- "Is there a minipark or a park near your home where you could walk to with your parents?" of the questionnaire for children aged 6-12;  
- "Is there a minipark or a park near your home where you could walk to in about 15 minutes?" of the questionnaire for children aged 13-17;  
- "Is there a minipark or a park near your home where you could walk to with your child in about 15 minutes?" of the questionnaire for the parents of children aged 0-12;  
For answers the following scale is used: yes; no; refuse to answer | Numerator: number of respondents of three surveys who answered 'Yes'  
Denominator: number of respondents who participated in three surveys  
Indicator is calculated as: $k = \frac{\text{numerator}}{\text{denominator}}$  
$N_{2.5} = 10^k$ |
| 2.6. | Proportion of children aged 6-17 and parents who mentioned that it is clean around the home and there is no litter | Subjective | The indicator is used to measure progress in providing children with access to clean yard areas in the city | Surveys of children aged 6-12, children aged 13-17 and the parents of children aged 0-12 | The indicator is estimated based on the answers to the question:  
- "Is it true that it is clean and there is no rubbish near your home?" of the questionnaire for children aged 6-12;  
- "Is it true that it is clean and there is no rubbish near your home?" of the questionnaire for children aged 13-17 and of the questionnaire for the parents of children aged 0-12.  
For answers the following scale is used: 4 - 'absolutely true', 3 - 'more true than false', 2 - 'true and false to the same extent', 1 - 'more false than true', 0 - 'absolutely false' | Numerator: $4^a + 3^b + 2^c + 1^d + 0^e$, where $a$ is the number of respondents of three surveys who answered 'absolutely true', $b$ is the number of respondents of three surveys who answered 'more true than false', $c$ is the number of respondents of three surveys who answered 'true and false to the same extent', $d$ is the number of respondents of three surveys who answered 'more false than true', and $e$ is the number of respondents of three surveys  
Indicator is calculated as: $k = \frac{\text{numerator}}{\text{denominator}}$  
$N_{2.6} = k/4*10$ |
| 2.7. | **Degree of satisfaction of children aged 6-17 and parents with the condition of the living environment** | **Subjective** | **The indicator is used to measure the quality of the infrastructure ensuring comfortable accommodation of children in the city** | **Surveys of children aged 6-12, children aged 13-17 and the parents of children aged 0-12** | **The indicator is estimated based on the answers to the question:**
*“Is it true that it is comfortable for you to live in your city?”* of the questionnaire for children aged 6-12;
*“Is it true that it is comfortable for you to live in your city?”* of the questionnaire for children aged 13-17;
*“Is it true that your city is child friendly?”* of the questionnaire for the parents of children aged 0-12.
For answers the following scale is used: 4 - ‘absolutely true’, 3 - ‘more true than false’, 2 - ‘true and false to the same extent’, 1 - ‘more false than true’, 0 - ‘absolutely false’ | **Numerator:** $4a + 3b + 2c + 1d + 0e$, where $a$ is the number of respondents of three surveys who answered ‘absolutely true’, $b$ is the number of respondents of three surveys who answered ‘more true than false’, $c$ is the number of respondents of three surveys who answered ‘true and false to the same extent’, $d$ is the number of respondents of three surveys who answered ‘more false than true’, and $e$ is the number of respondents of three surveys who answered ‘absolutely false’.
**Denominator:** number of respondents who participated in three surveys
**Indicator is calculated as:** $k = \frac{\text{numerator}}{\text{denominator}}$ | $n_{2.7} = k/4*10$ |

The normalized parameter value is calculated from the formula:

$$P_2 = \left(\frac{n_{2.1} + n_{2.2} + n_{2.3} + n_{2.4} + n_{2.5} + n_{2.6} + n_{2.7}}{7}\right)$$
## Description of indicators per parameter 3

### ‘Child safety in the city’

Justification for the choice of indicators:

A child friendly city warrants the right of every young citizen to be protected from exploitation, violence and abuse. Children must be safeguarded from the actions, which could harm their health and their physical, mental, spiritual, moral and social development.

<td>$n_{3.3} = 10^4\left(1 - \frac{k}{k+k_{RB}}\right)$, where $k_{RB}$ is the mortality rate for children and young people aged 5-17 in the Republic of Belarus per 1,000 children of this age. Information for the calculation of the numerator $k_{RB}$ is given on the site of the Ministry of Health of the Republic of Belarus at <a href="http://minzdrav.gov.by/ru/static/numbers/smertnost">http://minzdrav.gov.by/ru/static/numbers/smertnost</a>, and for calculation of the denominator - in the statistical reference book “Children and Youth of the Republic of Belarus”.</td>
</tr>
</tbody>
</table>
### 3.4. Proportion of children aged 6-17 and parents who mentioned that within the last 12 months their children had not been subjected to physical and/or psychological violence

**Subjective**

The indicator is used to measure progress in increasing child safety level when not at home

**Surveys of children aged 6-12, children aged 13-17 and the parents of children aged 0-12**

The indicator is estimated based on the answers to the question:

- “Have you come across a situation when you or somebody else in your presence was beaten, called names, unjustly accused?” of the questionnaire for children aged 6-12;
- “Have you come across a situation within the last 12 months when you or somebody else in your presence was beaten, called names, humiliated, unjustly accused?” of the questionnaire for children aged 13-17;
- “Have you come across a situation within the last 12 months when somebody from the children was beaten, called names, humiliated or unjustly accused” of the questionnaire for the parents of children aged 0-12.

For answers the following scale is used: yes; no; refuse to answer

**Numerator:** number of respondents of three surveys who answered 'No'

**Denominator:** number of respondents who participated in three surveys

Indicator is calculated as: $k = \frac{\text{numerator}}{\text{denominator}}$

$n_{3.4} = 10^k$

### 3.5. Proportion of children aged 6-17 and parents who think that it is safe for children to live in their city

**Subjective**

The indicator is used to measure child safety level in the city

**Surveys of children aged 6-12, children aged 13-17 and the parents of children aged 0-12**

The indicator is estimated based on the answers to the question:

- “Is it true that you have nothing to fear in your city?” of the questionnaire for children aged 6-12;
- “Is it true that it is safe to live in your city?” of the questionnaire for children aged 13-17;
- “Is it true that it is safe for children to live in your city?” of the questionnaire for the parents of children aged 0-12.

For answers the following scale is used: absolutely true; more true than false; true and false to the same extent; false; nothing to fear

**Numerator:** $4a + 3b + 2c + 1d + 0e$, where $a$ is the number of respondents of three surveys who answered ‘absolutely true’, $b$ is the number of respondents of three surveys who answered ‘more true than false’, $c$ is the number of respondents of three surveys who answered ‘true and false to the same extent’, $d$ is the number of respondents of three surveys who answered ‘false’

**Denominator:** number of respondents of three surveys

Indicator is calculated as: $k = \frac{\text{numerator}}{\text{denominator}}$

$n_{3.5} = k/4*10$
“Is it true that it is safe for children to live in your city?” of the questionnaire for the parents of children aged 0-12. For answers the following scale is used: 4 – ‘absolutely true’, 3 – ‘more true than false’, 2 – ‘true and false to the same extent’, 1 – ‘more false than true’, 0 – ‘absolutely false’.

Respondents of three surveys who answered ‘more false than true’, and e is the number of respondents of three surveys who answered ‘absolutely false’. Denominator: number of respondents who participated in three surveys.

Indicator is calculated as: $k = \frac{\text{numerator}}{\text{denominator}}$

The normalized parameter value is calculated from the formula:

$$p_3 = \frac{n_{3.1} + n_{3.2} + n_{3.3} + n_{3.4} + n_{3.5}}{5}$$
Justification for the choice of indicators:

A child friendly city warrants the right of every young citizen to have access to medical care. Children must receive quality medical services, knowledge, and skills necessary to keep healthy.

\]
Description of indicators per parameter 5
‘Education and Development’

Justification for the choice of indicators:

A child friendly city warrants the right of each young citizen to education. Children must receive quality education necessary for their continuous physical, intellectual, spiritual, moral, psychological and social development independent of their sex, language they speak, beliefs, nationality, ethnicity or social set-up, property status, health or any other circumstances.

</table>
### 6.3. Proportion of children aged 6-17 who have visited a cultural event (a performance, circus, concert, exhibition) during the last 12 months

**Subjective**

The indicator is used to measure progress in the arrangement of cultural activities for children by their family.

**Surveys of children aged 6-12 and 13-17**

The indicator is calculated based on the answers to the question:
- "Have you visited a cultural event (performance, circus, concert, exhibition) with your parents or relatives during the last 12 months?" of the questionnaire for children aged 6-12;
- "Have you visited a cultural event (performance, circus, concert, exhibition) with your parents or relatives during the last 12 months?" of the questionnaire for children aged 13-17.

For answers the following scale is used: yes; no; refuse to answer.

**Numerator:** number of respondents of 2 surveys who answered "Yes"  
**Denominator:** number of respondents who took part in 2 surveys

Indicator is calculated as: \( k = \frac{\text{numerator}}{\text{denominator}} \)

\[ n_{6.3} = 10^k \]

### 6.4. Proportion of children aged 14-17 who can, if necessary, get a part-time job when free from studies

**Subjective**

The indicator is used to measure progress in providing children with opportunities for secondary employment when free from studies.

**Surveys of children aged 13-17**

The indicator is calculated based on the answers to the question:
- "Do you have an opportunity to get a job when free from studies, if necessary?" of the questionnaire for children aged 13-17.

For answers the following scale is used: yes; no; refuse to answer.

**Numerator:** number of respondents of 2 surveys who answered "Yes"  
**Denominator:** number of respondents who answered "Yes" to the question "Have you reached 14?"

Indicator is calculated as follows: \( k = \frac{\text{numerator}}{\text{denominator}} \)

\[ n_{6.4} = 10^k \]

### 6.5. Degree of satisfaction of children aged 6-17 and parents with the system of organizing

**Subjective**

The indicator is used to measure the quality of providing services in the sphere of culture.

**Surveys of children aged 6-12, children aged 13-17 and the parents of**

The indicator is calculated based on the answers to the questions:
- "Is it true that there are lots of places in your city where you and your parents can..."

**Numerator:** \( 4^a + 3^b + 2^c + 1^d + 0^e \), where \( a \) is the number of respondents of three surveys who answered ‘more true than false’, \( c \) is the number of respondents of three surveys who answered ‘true and false to the same extent’, \( d \) is the number of respondents of three surveys who answered ‘true and false to the same extent’, \( e \) is the number of respondents of three surveys who answered ‘more false than true’.

\[ n_{6.5} = k/4\times10 \]
| children’s and young people’s leisure in the city | and organizing children’s leisure in the city | children aged 0-12 | enjoy your time?” of the questionnaire for children aged 6-12; “Is it true that you are happy with how your leisure-time activities are organized?” of the questionnaire for children aged 13-17; “Is it true that you are happy with how the leisure-time activities of your child are organized?” of the questionnaire for the parents of children aged 0-12. For answers the following scale is used: 4 - ‘absolutely true’, 3 - ‘more true than false’, 2 - ‘true and false to the same extent’, 1 - ‘more false than true’, 0 - ‘absolutely false’ | true’, and e is the number of respondents of three surveys who answered ‘absolutely false’. Denominator: number of respondents who participated in three surveys. Indicator is calculated as: $k = \frac{\text{numerator}}{\text{denominator}}$

The normalized parameter value is calculated from the formula:

$$P_6 = \frac{n_{6.1} + n_{6.2} + n_{6.3} + n_{6.4} + n_{6.5}}{5}$$
## Description of indicators per parameter 7

</table>
| 7.3 | Proportion of minors with a police record | Objective | This indicator is used to measure the progress in preventing law violations by minors | The data for the city is provided by the Internal Affairs Department of the District Executive Committee | Departmental reporting form No. | Numerator: number of children aged 0-17 in the city with a police record multiplied by 1,000; Denominator: number of children aged 0-17 in the city; Indicator is calculated as: \( k = \frac{\text{numerator}}{\text{denominator}} \)

\[ n_{7.3} = 10^4(1 - k/k_R) \]

where \( k_R \) is the number of children aged 0-17 in the Republic of Belarus with a police record multiplied by 1,000 and divided by the number of children aged 0-17 in the Republic of Belarus. The information to calculate \( k_R \) is contained in the annual statistical data book “Law Violations in the Republic of Belarus”.

| 7.4 | Proportion of parents who have ever received consultations or training on responsible parenting | Subjective | The indicator is used to measure progress in providing a child with the possibility of development in the family | Surveys of parents of children aged 0-12 | The indicator is estimated based on the answers to the question “Did you receive consultations or training on responsible parenting?” of the questionnaire for the parents of children aged 0-12. For answers the following scale is used: yes; no; refuse to answer | Numerator: number of respondents of the survey who answered ‘Yes’; Denominator: number of respondents who participated in the survey; Indicator is calculated as: \( k = \frac{\text{numerator}}{\text{denominator}} \)

\[ n_{7.4} = 10^k \]

| 7.5 | Proportion of children aged 6-17 who have the possibility to contact a relevant specialist or call a hotline to discuss their problems without parents knowing it | Subjective | The indicator is used to measure progress in providing a child with the possibility of receiving information about his/her problems | Surveys of children aged 6-12 and children aged 13-17 | The indicator is estimated based on the answers to the question: “Could you if needed discuss your problems with the teacher or call a crisis counseling line?” of the questionnaire for children aged 6-12; “Do you have the possibility if needed and without your parents knowing it” | Numerator: number of respondents of two surveys who answered ‘Yes’; Denominator: number of respondents who participated in two surveys; Indicator is calculated as: \( k = \frac{\text{numerator}}{\text{denominator}} \)

\[ n_{7.5} = 10^k \]
7.6. Degree of satisfaction of children aged 13-17 and parents with the system of arranging assistance to children who find themselves in difficult situations.

<table>
<thead>
<tr>
<th>Subjective</th>
<th>The indicator is used to measure the quality of provided services in providing help to the children who find themselves in difficult situations.</th>
<th>Surveys of children aged 6-12 and children aged 13-17 and surveys of the parents of children aged 0-12</th>
<th>The indicator is estimated based on the answers to the question: “Is it true that in your city you get help in any situation?” of the questionnaire for children aged 6-12; “Is it true that in your city you get help in any situation?” of the questionnaire for children aged 13-17; “Is it true that in your city your child will get help in any difficult situation?” of the questionnaire for the parents of children aged 0-12. For answers the following scale is used: 4 - ‘absolutely true’, 3 - ‘more true than false’, 2 - ‘true and false to the same extent’, 1 - ‘more false than true’, 0 - ‘absolutely false’</th>
</tr>
</thead>
</table>

Numerator: $4a + 3b + 2c + 1d + 0e$, where $a$ is the number of respondents of three surveys who answered ‘more true than false’, $c$ is the number of respondents of three surveys who answered ‘true and false to the same extent’, $d$ is the number of respondents of three surveys who answered ‘more false than true’, and $e$ is the number of respondents of three surveys who answered ‘absolutely false’. Denominator: number of respondents who participated in three surveys. Indicator is calculated as: $k = \frac{\text{numerator}}{\text{denominator}}$

The normalized parameter value is calculated from the formula:

$$P_{7} = \frac{n_{7.1} + n_{7.2} + n_{7.3} + n_{7.4} + n_{7.5} + n_{7.6}}{6}$$

The calculation of the city’s child-friendliness index:

$$I = \frac{P_{1} + P_{2} + P_{3} + P_{4} + P_{5} + P_{6} + P_{7}}{7}$$
Toolkit for the calculation of subjective indicators

The following questionnaires are the toolkit for the surveys:

1. Questionnaire for children aged 6-12 to assess a city’s child-friendliness.
2. Questionnaire for children aged 13-17 to assess a city’s child-friendliness.
3. Questionnaire for the parents of children aged 0-12 to assess a city’s child-friendliness.

Currently the questionnaires contain the minimum number of questions needed to calculate the indicators. If the city government needs to examine the situation in more detail, necessary questions could be added to the developed questionnaires, and in doing so the questions contained in the developed questionnaires could be by no means shortened or replaced.

Preparation to the survey analysis

Before analyzing the three surveys one should number the filled in questionnaires, and select those suitable for analysis.

A questionnaire for children aged 6-12 is suitable for analysis if it meets the following criteria:
- the respondent’s age is indicated as 6-12;
- the respondent’s sex is indicated;
- the respondent indicated the city under assessment as his/her place of permanent residence;

A questionnaire for children aged 13-17 is suitable for analysis if it meets the following criteria:
- the respondent’s age is indicated as 13-17;
- the respondent’s sex is indicated;
- the respondent indicated the city under assessment as his/her place of permanent residence;

A questionnaire for the parents of children aged 0-12 is suitable for analysis if it meets the following criteria:
- at least one answer: ‘1. less than 6 years old’ and ‘6-12 years old’ is ticked in responding the question “To what age group does your child/do your children belong?”;
- the respondent indicated the city under assessment as his/her place of permanent residence;

The form for calculating a city’s child-friendliness index

The form for calculating a city’s child-friendliness index (hereinafter referred to as Index) is a book in Excel format consisting of 12 sheets with their names indicated under the window:

4. Survey 6-12 - the sheet for entering survey data for children aged 6 - 12.
7. Res 6-12 – the sheet for calculation of the survey results for children aged 6-12.
10. Survey results – the sheet for calculation of the survey results for children and parents.
11. Index – the sheet for calculating the Index.
12. Chart – the sheet for constructing the chart illustrating the calculation results.

To fill in the ‘Statistics Belarus’ sheet use the data from three statistical data books regularly published at the web site of the National Statistical Committee of the Republic of Belarus (http://belstat.gov.by/index.htm) and the site of the Ministry of Health of the Republic of Belarus (http://minzdrav.gov.by/ru/static/numbers/smertnost):

- “Children and Youth of the Republic of Belarus” – published once every 2 years;
- “Health of the Population of the Republic of Belarus” – published once every 3 years;

To fill in the “Statistics city” use the data stated in the departmental and statistical reports submitted by the divisions of the city/district executive committee:

- Statistical Department/Directorate;
- Education, Sports and Tourism Committee / Directorate / Department;
- Health Committee / Directorate / Department;
- Culture Committee / Directorate / Department;
- Internal Affairs Committee / Directorate / Department.

The sheets ‘Survey 6-12’, ‘Survey 13-17’, “Survey parents” are used to enter the data from the survey questionnaires for children aged 6-12, children aged 13-17 and parents of children aged 0-12 respectively.

Internal Data Quality Audit

After calculating the Index with the form it is necessary to check the quality of data input for the calculation of objective and subjective indicators. A person who did not participate in filling the form should be commissioned to do this job.

Data quality audit per objective indicators is done by detail test of basic source documents, which are responses to the information requests from the structural divisions of city/district executive committees, and the inspection of the accurateness of filling in Excel tables based on these documents. During the comparison one has to check both whether the source documents are present and if the provided information meets the requirements of the Index calculation methodology.

The survey data input quality control is performed as follows:

- You should check whether the questionnaires of three surveys are suitable for analysis in accordance with the criteria listed in the section Preparation to the Survey Analysis. The data from the questionnaires not suitable for analysis entered into the Index calculation form should be deleted.
- From the questionnaires of each survey suitable for analysis you should select randomly 20% of questionnaires, and these questionnaires should be checked for the consistency of data input into
Excel tables. If there is at least one input error in a questionnaire it is considered that the questionnaire data is entered incorrectly. If input errors occur in more than 10% of questionnaires, you should perform the detailed test of the survey data input. All identified errors of data input should be corrected.

**Recommended Timeline for the Index Calculation**

The data for the calculation of objective indicators is collected at the end of the year preceding the year for which the Index is calculated. For example, if the Index is calculated in 2013, the data per objective indicators is collected for 2012.

The process of data collection to calculate objective indicators and the surveys should be started in April at least once in two years. April is the most appropriate month for the evaluation, since the state statistics for the calculation of the objective indicators is already available, the preparation for school exams has not yet started and the pupils are not that overloaded and can be involved in the survey.
